

Life Force Rescue Systems Unveils Force 4 Generation

Morgantown, West Virginia - Life Force Rescue Systems™ is proud to unveil its newest innovation, the Force 4™ Generation.

"As a light duty rescue vehicle, the Force 4™ Generation is the most powerful, most versatile, and most intelligent rescue apparatus on the market today," said Leonard "Len" Hancock Jr., Life Force's Chief Operating Officer. "We're proud to say we developed and built it right here in Morgantown, West Virginia."

The state-of-the-art system utilizes a superior hydraulic design that runs rescue tools such as the "jaws of life" faster, with more power, and more efficiently than any other rescue system ever developed. Force 4™ Generation also has the industry's first intelligent remote control which gives first responders the critical data they need to save lives faster.

"In addition," said Leonard Hancock Sr., Life Force's President, "the unique Urban Search and Rescue circuitry, advanced lighting capabilities, and many more features add to its versatility making Force 4™ the most powerful light duty rescue system available."

The development of the Force 4™ Generation sprang from a much larger system Life Force invented with Amkus Rescue Systems called, "The Ultimate." It is currently in use across the nation on only heavy rescue vehicles and sold exclusively by Amkus. The Ultimate is a power takeoff driven hydraulic rescue system that provides superior performance with maximum versatility.

"We took that innovation to the next level," explained Leonard Hancock Sr., Life Force's

President. "Why not take that same high-powered, state-of-the-art life saving technology and put it in smaller, affordable rescue vehicles so more first responders can use it."

Some of the many uses the Force 4™ Generation is designed for include: first responder for auto accidents, natural disaster support, electricity supply & lighting, building collapse response, terrorism response, small and large fires, etc.

Before introducing and fully producing a light duty rescue vehicle, research was conducted in over forty cities spanning the United States to assess fire departments' needs. With the help of this research, LifeForce Rescue Systems was able to design the vehicle to meet and exceed the needs voiced by professionals in the field.
